Screen 1

A doctor is diagnosing a patient. The chart on this screen shows the number of previous patients with similar symptoms, out of 1,000, who were diagnosed with each of four possible diseases. Two of the diseases are allozedic diseases (L1 and L2) and two are hypozedic diseases (Y1 and Y2).

The treatment depends on whether the patient has an allozedic or a hypozedic disease. Do you think the patient has an allozedic or a hypozedic disease, and how confident are you?

Absolutely certain that the patient has an allozedic disease.

-100

0

+100

Absolutely certain that the patient has a hypozedic disease.

Screen 2

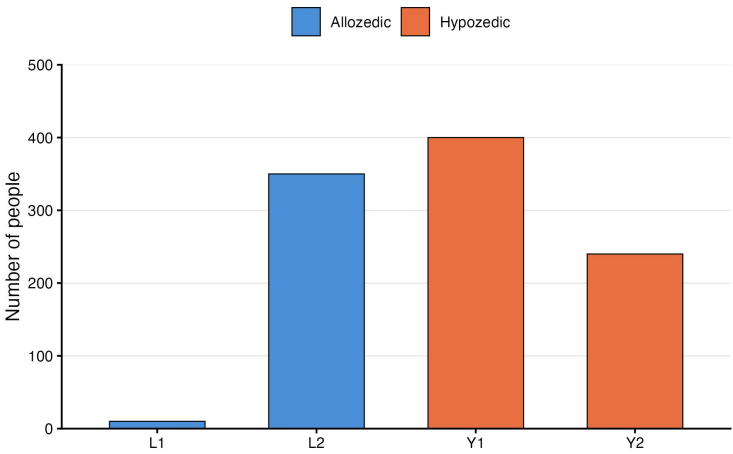

Two tests are run to gather more information. The results are shown below. These tests are fairly accurate but sometimes give false results.

Test 1 says the patient most likely has Y1.

Test 2 says the patient most likely has L1.

The tests can't both be accurate. Which test result is more likely to be accurate?

- ☐ Test 1
- ☐ Test 2

Your initial response:

Taking into account the chart and these test results, do you think the patient has an allozedic or a hypozedic disease, and how confident are you?
